About Us

Quality Assurance services from an engineer who has first-hand experience and knowledge in development, design, and business.

Bug reporting aims at easy reproduction of reported issues, while app

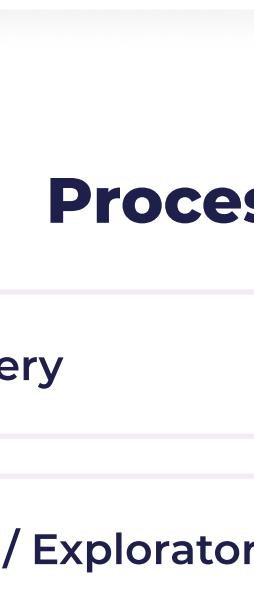

testing guarantees that every application component is functioning as expected

SERVICES

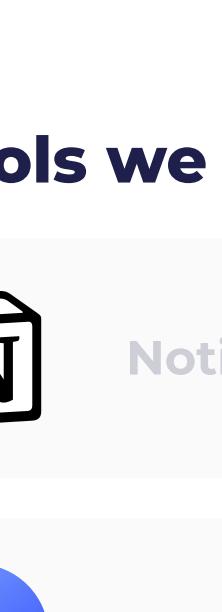

Testing

We provide an all-encompassing testing approach beginning with the development of a comprehensive test plan that defines the strategy and timeline of our testing process. Our team meticulously crafts detailed test cases and scenarios, simulating various user interactions to thoroughly examine your application from multiple perspectives. By utilizing a range of advanced test design techniques, we ensure that every aspect of your application is examined for both functionality and usability, leaving no stone unturned in our quest for perfection.

Bug Report

Our bug reporting process extends beyond simple identification and documentation. We adopt a user story perspective while writing tickets, providing a clear, detailed account of the problem that goes beyond technical jargon. This gives the development team an in-depth understanding of the issue, how it affects the user experience, and crucially, its impact on the overall stability of the product. Through clear communication and comprehensive documentation, we ensure seamless integration between the QA and development teams, making the bug resolution process efficient and effective.

Automation

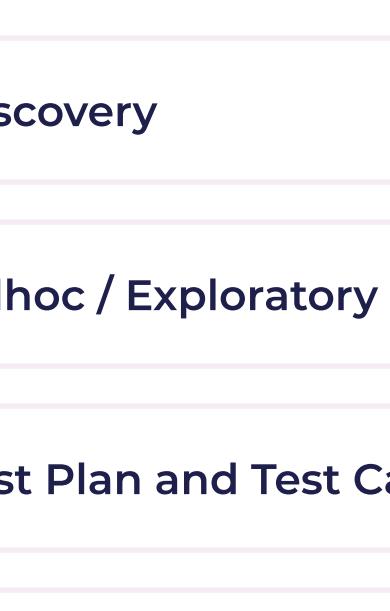

Leveraging powerful tools like Selenium and Testim, we implement sophisticated automated tests designed to quickly and effectively scan your entire application for potential errors. Our automation strategies significantly reduce the time taken to assess the application's health, without compromising on the thoroughness of the check. We ensure every component of your application is functioning as expected, providing quick, insightful feedback on the application's overall performance and stability.

This allows for faster identification of issues and swift rectifications, contributing to the delivery of a high-quality product.

Process

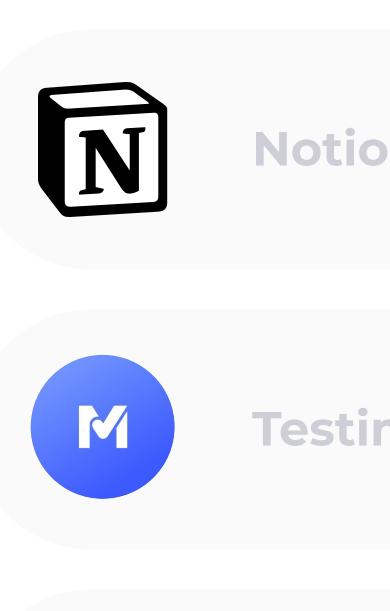

- 1 Discovery
- 2 Adhoc / Exploratory testing
- 3 Test Plan and Test Cases
- 4 Automated testing
- 5 Rgress testing
- 6 Bug Documentation and Issue tracker
- 7 Health Report
